

The vaccine will not give you COVID-19.

The vaccine does not contain any part of the live virus and cannot cause a COVID-19 infection.

The COVID-19 vaccine may protect against multiple strains.

Although the virus has made small mutations, the vaccines have proven to be successful in fighting the strains currently circulating.

You should still be vaccinated if you've had COVID-19.

There is not enough information to know how long people are protected from getting COVID-19 after they've had it.

The quick development of the vaccine does not make it unsafe.

Decades of scientific progression and worldwide collaboration among scientists made the safe and rapid development possible.

The COVID-19 vaccine will not alter your DNA.

The vaccine triggers an immune response that produces antibodies to fight COVID-19. It does not interact with DNA in any way.

We know exactly what is in the COVID-19 vaccine.

The ingredient lists of all approved vaccines are available from the manufacturers.
