

The vaccine will not give you COVID-19.

The vaccine does not contain any part of the virus and cannot cause a COVID-19 infection.

The quick development of the vaccine does not make it unsafe.

Decades of scientific progression and worldwide collaboration among scientists made the safe and rapid development possible.

The COVID-19 vaccine may protect against multiple strains.

Although the virus has made small mutations, the vaccines have proven to be successful in fighting the strains currently circulating.

The COVID-19 vaccine will not alter your DNA.

The vaccine triggers an immune response that produces antibodies to fight COVID-19. It does not interact with DNA in any way.

You should still be vaccinated if you've had COVID-19.

There is not enough information to know how long people are protected from getting COVID-19 after they've had it.

We know exactly what is in the COVID-19 vaccine.

The ingredient lists of all approved vaccines are available from the manufacturers.
